DETAILED ACTION

1. This communication is responsive to the applicant's application filed 05/15/2006.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-3, 8, 11-14 and 19 are rejected under 35 U.S.C. 102(b) as being anticipated by Eguchi (US-5,278,780).

Regarding Claim 1, Eguchi discloses an active noise control apparatus (Figure 1) for reducing noise from noise source (1), comprising: a first detector (3) for detecting noise produced by the noise source; a generalized finite impulse response filter (6) for receiving noise signals of the detected noise from said first detector, and generating control signals for reducing the noise from the noise sources (y); and a sound generator (5) for producing sound based on said control signals from said generalized FIR filter substantially canceling the noise from the noise source.

Regarding Claim 2, Eguchi further discloses said generalized FIR filter is a feedforward compensator (Figure 1).

Art Unit: 2614

Regarding Claim 3, Eguchi further discloses said first detector (3) is located downstream of the noise source (1), and said sound generator (5) is located downstream of said first detector.

Regarding Claim 8, Eguchi further discloses a second detector (4) for detecting noise down stream of said sound generator.

Regarding Claim 11, Eguchi further discloses the first detector and second detector are microphones, and said sound generator is a speaker (Col. 7, lines 46-54).

Regarding claim 12, Eguchi discloses a method for reducing noise from a noise source in an active noise control system, comprising: detecting first noise produced by the noise source (1); generating control signals (y) from a generalized finite impulse response filter (6) for reducing the first noise from the noise source based on a first signal of said detected noise; and producing sound (5) based on said control signals for substantially canceling said first noise from the noise source.

Regarding claim 13, Eguchi further discloses said generalized FIR filter is a feedforward compensator (Figure 1).

Regarding claim 14, Eguchi further discloses said first noise (1) is detected by a microphone (3) located downstream of the noise source, and said sound is produced by a speaker (5) located downstream of said microphone.

Regarding claim 19, Eguchi further discloses detecting second noise (4) after said sound based on said control signals has been produced.

Application/Control Number: 10/579,520

Art Unit: 2614

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Page 4

5. Claims 4, 5, 7, 15, 16 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Eguchi in view of Heuberger et al (A Generalized Orthonormal Basis for Linear Dynamical System, IEEE Transactions on Automatic Control, Vol. 40, No 3, pp. 451-465).

Regarding Claims 4 and 15, Eguchi discloses an apparatus as stated apropos of claim 1 and 12. Heuberger et al. discloses an FIR transfer function in a form as claimed (pg. 459, Col. 2, line 34) described by an orthonormal basis, direct feed through term, and optimal filter coefficients. It would have been obvious to one of ordinary skill in the art to modify the FIR filter of the active noise control apparatus and method of Eguchi by an orthonormal basis, as shown by Heuberger et al, in order to generate optimal filter coefficients for the FIR filter to improve accuracy of active noise control for the active noise control apparatus.

Regarding Claim 5 and 16, Heuberger et al. further discloses constructing functions based on recursive equations (Pg. 456, Col. 1).

Regarding Claims 7 and 18, Heuberger et al. further discloses identifying coefficients through a least-squares routine (Pg. 452, Col. 1).

Art Unit: 2614

Allowable Subject Matter

6. Claims 6, 17, 9-10 and 20-21 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Regarding claims 6 and 17, the prior art does not teach or fairly suggest function $f_k(q)$ is initialized by a predetermined dynamical model that includes initial approximate information dynamics of the FIR filter.

Regarding claims 9, 10, 20, and 21, the prior art does not teach or fairly suggest a signal of the noise detected by the second detector is described by the equation as claimed.

7. Claims 22-27 are allowed over prior art of record, the prior art does not teach or fairly suggest a control signal generated based on the equation as claimed.

Conclusion

IMPORTANT NOTICE

The Group and/or Art Unit location of your application in the PTO has changed. To aid in correlating any papers for this application, all further correspondence regarding this application should be directed to **Group Art Unit 2614**.

Art Unit: 2614

8. Any inquiry concerning this communication or earlier communications from the examiner should

be directed to Xu Mei whose telephone number is 571-272-7523. The examiner can normally be reached

on maxi flex.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor,

Vivian Chin can be reached on 571-272-7848. The fax phone number for the organization where this

application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application

Information Retrieval (PAIR) system. Status information for published applications may be obtained from

either Private PAIR or Public PAIR. Status information for unpublished applications is available through

Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC)

at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative

or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-

1000.
